

AUTOMATIC OPTICAL INSPECTION

InterElectronic

INTRODUCTION

InterElectronic Hungary Ltd. offers equipments, machines and different materials (ESD) of different production technologies (SMT/THT/LED). Including high quality, special request fulfilling soldering machines, devices, tools, instruments and materials for the electronic industry and services.

SERVICES

Our each and every product has a warranty granted by the InterElectronic Hungary Ltd. For more complex appliances our company offers a well-needed training for set up and usage. We grant the repair of all of the products traded by our company during and after the warranty period. As well as we guarantee the continuous supply of accessories and instruments.

DEMONSTRATION

In case if any of our products aroused your interest the InterElectronic Hungary Ltd. would be glad to visit your company and hold a presentation of the product of your interest. As far as possible we serve you by bringing demo devices with us. In the most cases of our products we are proud possessors of references nation-wide. Major machines also could be observed at our partners' site.

PRICE LIST

Most of the prices of our products can be requested on our website and will be sent via email to you. In case of special and more complex machines the prices are given after consultation individually through a price offer. If you are interested in more information or user manuals of our products we recommend you to visit our website (www.interelectronic.com), which is updated continuously with professional information. We also recommend you to visit our office, where you can purchase any of the needed devices and spare parts of the product of your interest.

ORDER/SHIPPING

Our soon to be partners are welcomed to be helped via telephone, fax or e-mail. We use different ways of delivery, depending on the preference of our partner. We can deliver your purchased product by ourselves, by freight or courier service. The way of delivery might be negotiated previously. We offer you cash on delivery nation-wide!

TABLE OF CONTENT

GOEPEL electronic has been one of the pioneers of the most innovative electrical test technology for electronic components and PCBs, JTAG/Boundary Scan. All engineering tasks required to introduce the Boundary Scan technology up to the generation of product-specific test programs as well as training seminars are part of the overall customer support by GOEPEL electronic. In the meantime, Automated Optical Inspection has developed to one of the most commanding test technologies in electronic production. In the first year just a few systems were manufactured, but relatively quickly a product range emerged that found an appropriate infrastructure in the new company building, which was opened in 2003. Additionally, the functional test of electronic assemblies and devices, in particular for Automotive Testing, has been one of the supporting pillars in the Company's business activities. They are mainly focussed on the requirements of the automotive industry. Furthermore the customized Functional Test Systems optimally suit for the automation of test runs. Integrated in a production line, as test system for final products or as repair station, versatile requirements can be realised with these systems.

This AOI system can be individually integrated into your process of PCB assembly. The various error output varieties per screen, label or test protocol are suited for many PCBs production methods.

A multitude of variants and settings in illumination and camera make the system a highly precise and fast inspection device. Customized configurations and technical upgrades are also possible.

AOI AdvancedLine

Inline AOI System for
flexible Integration
Opportunities

The AdvancedLine AOI system's decisive advantage is the multitude of opportunities for inline integration into the production process. The system can be utilized at each position in a PCB production line. No requirements or specifications will remain unfulfilled as your boards can be transported in each direction.

AOI TurboLine

Inline AOI System for High-End Inspection

The TurboLine AOI system's special features are opportunities for double-sided inspection as well as various camera and illumination configurations.

It is possible to inspect the PCB bottom side without assembly turning. This is a decisive advantage over common AOI systems as in-line speed is guaranteed. The rotatable angled-view and the segmented band module also help for faster inspection.

AOI THT-Line

AOI System for efficient Quality Check of THT Assemblies

AOI System for efficient quality assurance of THT Assemblies in the production process. It can be utilised either per manual feeding or as an inline system utilising a roller conveyor transport system. THT-Line enables the automated inspection of THT assemblies with up to 80 mm component height.

Polarity check at THT components

Typical solder faults

MAXIMUM FAULT DETECTION

- Unique multispectral illumination
- THT component, THT solder joint and wave-soldered SMD component inspection
- Freely configurable test functions and illumination opportunities

INTEGRATION OPTIONS FOR THT PRODUCTION PROCESS

- Manual or automated feeding via accumulating transport system
- Component side and solder side can be inspected at multiple positions within the production line
- Solder side inspection either on the upper conveyer belt or during the PCB return in the lower system area

SPEED ADVANTAGES OVER COMMON AOI SYSTEMS

- "Flip free" double-sided inspection of THT assemblies
- Multiple and independently working AOI modules in one system

Automated X-Ray Inspection (AXOI)

AOI X-Line 3D

Combined 3D X-ray and Optical Inspection at Production Line Pace

For maximum fault coverage using digital tomosynthesis with outstanding inspection speed.

Benefits of the 3D X-Ray Inspection:

- Safe inspection of double-sided assembled PCBs
- Reconstruction of any layers
- Spatial allocation of detected faults
- Fast and user friendly test program generation by using a single unified library

Image Capture

Repair station- and analysis software

IMAGE CAPTURE

- Complete 3D capturing can achieve test speeds of up to 40cm²/s by revolutionary GigaPixel™ technology
- Reconstruction processes possible due to tomosynthesis
- Simultaneous 3D x-ray inspection of top and bottom side of a double sided PCB
- Optimal adaptation to future components and manufacturing requirements via Software XI-PILOT
- Algorithm library suitable for all common components
- Minimal times for test program generation

PROCESS INTEGRATION

- Repair station software enables a visualisation of detected faults in various forms of presentation
- Powerful analysis software allows for the inspection of single layers objective rating of production quality and throughput with the help of comprehensive statistical evaluation package with numerous filter settings
- Warning and action limits as well as trend analyses are definable in the SPC Module

Automated X-Ray Inspection (AXOI) AOI X-Line 3D Specification

High-Speed X-Ray System for Maximum Test Coverage

OptiCon X-Line 3D is an automatic three-dimensional measuring X-ray inspection system for rapid inspection of printed circuit board assemblies. OptiCon X-Line 3D is based on a patent-pending detector concept, which has been developed in-house by GOEPEL electronic. Using a maintenance-free microfocus X-ray tube it allows for real-time multi-angle image capture.

A continuously scanning image acquisition unit provides for high-resolution X-ray images, which are acquired, pre-processed and re-constructed during axis motion. This enables an inspection throughput of up

to 40 cm²/s with full 3D acquisition of the board assembly. Reconstruction procedures based on digital tomosynthesis allow for concurrent inspection of top and bottom sides of assemblies, which are populated on both sides – within a single run. In addition, tomosynthesis allows for distinct analyses of defined board layers and inspection of solder joints with a reliable process. Inspection tasks, which can't be covered by X-ray technology, like polarity checks, character and/or colour recognition, will be addressed by an integrated AOI module.

DATABASE

- Layered reconstruction of components and solder joints
- Test program generation and actual inspection process are executed with geometrically calibrated, distortion free imaging of the real test objects
- Fast test program generation based on CAD data using a component library
- Predefined test algorithms and classifiers

FAULT DETECTION

- Full-sized 3D x-ray inspection (AXI) allows layered analysis of all solder joints of a PCB within the production process
- Safe detection of critical faults and spatial allocation of the detected defects
- Fast test program generation based on CAD data using a component library
- Predefined test algorithms and classifiers

FAULT ANALYSIS

- Powerful analysis software provides the safe evaluation of detected faults
- Detailed examination of the inspection results in various Z-levels
- Clear representation of soldered joints and components via visualisation of selected areas
- Predefined test algorithms and classifiers

Automated X-Ray Inspection

AXOI OptiCon X-Line 3D

Stand-alone (off-line operation)

Integrated in the production line
(in-line operation)

INSPECTION EXAMPLE

Board assembly:	160 mm x 100 mm, assembled on both sides
Components:	509
Package styles:	6 x BGA, 20 x SO, 424 x Chip, 12 x THT
Solder joints:	2977
Resolution:	12 μ m
AOI fields of view:	8

BOARD CONVEYOR SYSTEM

Division of the system in three shielded segments allows for concurrent operation of board handling and inspection operations.

CORRECTION OF BOARD WARPAGE & STABILITY MONITORING

Automatic correction of board warpage allows for precise reconstruction of the board in Z-axis direction

Automated X-Ray Inspection

X-Ray: 2D, 2.5D & 3D

Maintenance and Safety

The OptiCon X-Line 3D uses a shielded, maintenance-free micro-focus X-ray source and a detector with high service lifetime, in-house-developed by GOEPEL electronic. Exchanging the X-ray source or the detector is simple and fast-ensuring minimal down time. The compact system captivates through its extraordinary accessibility. Two service hatches and two doors facilitate the access to

3D X-ray Inspection with OptiCon X-Line 3D

Principle of Image Acquisition

The PCB is radiated from at least nine different angles. The resulting images allow for the reconstruction of distinct layers.

Benefits of 3D X-ray Inspection

- safe inspection of PCBs with components on both sides
- reconstruction of arbitrary layers
- spatial assignment of detected faults
- rapid and comfortable inspection programme generation through use of a unified library

Fields of Application

- 3D X-ray inspection in in-line production
- inspection of PCBs with components on both sides
- qualitative inspection of all solder joints (e.g. BGA, QFN)
- check for component presence, offset and shorts
- measurement of voids in different layers
- inspection of complex board assemblies with superimposed soldering layers and assembled heat sinks (integrated power electronics)

all important system components. Redundant safety circuits and perfect radiation protection guarantee utmost safety. The emitted radiation dose is below the detection limit of conventional radiation detectors. Operating the system is therefore totally safe.

- measurement of the hole-fill in THT/THR solder joints
- inspection according to IPC-A-610 requirements

2.5D X-ray Inspection

Principle of Image Acquisition

Superimposed solder joints (e.g. top and bottom side of the assembly) are optically separated in the projections by means of angular radiography.

Disadvantages

- huge programming effort for assemblies with components on both sides due to manual parameter setting for all acquired images
- no unified library available
- long inspection duration

2D X-ray Inspection

Principle of Image Acquisition

Assemblies are radiated through orthogonally.

Disadvantages

- superimposed solder joints (e.g. top and bottom side of the assembly) can't be inspected
- insufficient information about the quality of BGA solder joints
- no spatial assignment of detected faults

Different projections of a board with components on both sides during 3D X-ray inspection

Optically separated solder joints by means of angular radiography using 2.5D X-ray inspection

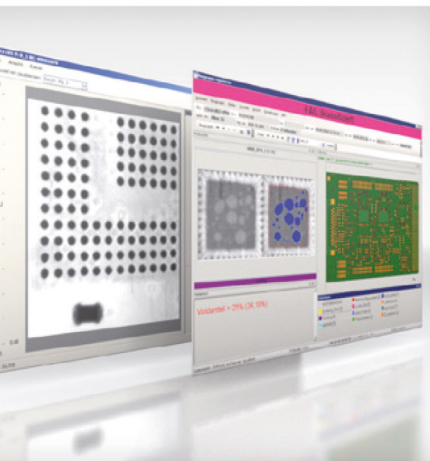

Optically separated solder joints by means of angular radiography using 2.5D X-ray inspection

AXOI Automated X-Ray Inspection System Software OptiCon XI-PILOT

OptiCon XI-PILOT software interface

Repair station and analysis software

Statistical evaluation and SPC module

Detection of an unsoldered BGA ball in various layers of the solder joint

INTELLIGENT SOFTWARE CONCEPT RAISES THE BAR - AXI/AOI PROGRAMMING FEATURING THE SAME USER INTERFACE

- system software OptiCon XI-PILOT
- off-line programming software
- repair station software
- analysis software
- statistics software
- SPC software

The OptiCon XI-PILOT system software is an open concept for a maximum fault-coverage and optimised adaptation to future component packages and manufacturing requirements. Automatic X-ray and optical inspections are programmed using the same user interface. The supplied component library, which complies with IPC standards, is linked with inspection algorithms and serves as the basis for the inspection of all common component packages. The measured values and features extracted by the algorithms will be automatically classified, resulting in minimum programme generation time.

Once the initial acquisition of all required X-ray images has been completed, the entire inspection programme generation and library adaptation can be done in the office using off-line programming software. The repair station software features a vivid visualisation of detected faults in different representations. Linked to this repair station software there is a powerful analysis software, which allows for viewing of all faults of a component in distinct layers. The statistics software, equipped with pre-defined filters and the possibility to create user-defined filters, enables the fast detection of main faults as well as an objective evaluation of production quality and throughput. The settable warning and action limits of the SPC module, as well as trend analyses allow for taking predictive measures before an actual fault occurs.

Rapid Inspection Programme Generation through Effective use of Libraries

Due to the reconstruction of components and solder joints layer-by-layer, test programme generation and actual inspection processes are executed with geometrically calibrated, distortion-free imaging of the actual inspection objects. This enables a rapid and effective inspection programme generation based on CAD data and the use of a component library with pre-defined inspection algorithms and classifiers. Component packages, which are not included in the supplied component library, can be comfortably created using the integrated CAD editor.

Reliable Failure Analysis through Vivid Visualisation

For reliable assessments of detected faults at the verification or repair station, the original X-ray image of the solder joint will be complemented by an image, which has been analysed by software algorithms and marked with colours. In addition, a powerful analysis software is available that aids the user in assessing the fault in different Z layers. The 3D visualisation of selected areas facilitates the vivid presentation of solder joints and components.

Maximum Fault-Coverage at Outstanding Inspection Speed

The comprehensive 3D X-ray inspection permits analysis of all solder joints of an assembly layer-by-layer in-line with the line speed. This ensures a reliable detection of critical fault types and the spatial assignment of the recognised faults.

AXOI Automated X-Ray Inspection

Weight	approx. 2.5 t

PILOT 6

A well-balanced Software Concept

The OptiCon PILOT software provides powerful functions for component recognition, solder joint and short inspection, OCR, colour verification as well as solder paste inspection.

In addition to the intelligent component recognition based on automated characteristic extraction from real images, the solder joint quality is determined by a complex grey value analysis using a range of illumination types.

PILOT 6

Maximum failure detection through multiple inspection methods and verification of inspection depth

Efficient virtual programming for external generation and optimization of test programs

Individually adaptable test functions and library entries

SmartGuide

Test program generation – easy as handling a smartphone ...

Clear and easy user guidance from data import to final inspection

Extremely easy and fast test program generation without AOI knowledge

fully operable via touch screen

Reference-Database

The integrated reference database guarantees safe and documented fault detection at optimised false call rate. It enables the storage of previously detected faults and their verification after test program modifications. In case of inconsistent results after a program check, all corresponding parameters will be displayed. Likewise, the reference database serves as storage for PASS examples to ensure the stability of optimised test programs.

OptiCon PILOT Software

Ease of use • inspection • reliability • flexibility

Data import

of various formats (Gerber, Pick-and-Place, ODB++, etc.)
for flexibility and ease of use

Component library

with numerous packages; adaptable for product
specific applications

Inspection functions

for IPC compliant quality assurance and layout independent
inspection

Efficient inspection

for low volume production based on fast program generation
and comfortable optimization

Operator guidance

with smartphone-like interface for easy test program
generation even for inexperienced users

Unified management

of AOI/AXI/SPI data for joint failure verification, statistics
and MES communication

Maximum fault coverage

based on a wide range of inspection functions including
detailed coverage reports

PILOT 6

AOI , AXI and SPI networking

PILOT Connect

Networking all the inspection data from automatic optical, X-ray and solder paste inspections

Repair station with a clear representation of the AOI, AXI and SPI test data at a glance

Opportunities for process analysis and optimization

Interfaces via ME and traceability systems

Integration with external systems possible

Integrated user management for all related systems and software modules

Extremely easy and fast test program generation without AOI knowledge

Convenient data maintenance tools

OptiCon PILOT Connect all data at a glance

Supporting operators

Use at verification and repair stations

All data from the AOI, AXI and SPI test systems is visible at a glance

It is possible to fully assess errors

Targeted checking

Comprehensive, automatic system checking of ambiguous errors

Better assessment due to additional data capture

Process analysis and optimization

Analysis, optimization and monitoring of the manufacturing process through statistical evaluation of the linked inspection data

Flexible use of different database systems

Connection to different database systems such as MySQL, MSSQLServer and Oracle Database

Integrated user management

Access to all computers and services that you are authorized for with a single log-on

Common use of CAD data

Comprehensive system use of imported CAD data for creating the test programs

PROFESSIONAL TOOLS FOR ELECTRONICS MANUFACTURERS TO IMPROVE CONTROL

INSPECTOSCAN C A3

InspectoScan

THE INSPECTOSCAN RANGE OFFER SOLUTIONS FOR BOTH THE ASSEMBLY
SMD AND PTH, FINISHING AND COATING ENVIRONMENTS

INSPECTOSCAN S A3

InspectoScan
